

Aramus™ Single-Use 2D Bag Assemblies

High-grade, gamma-stable fluoropolymer film provides higher purity and greater reliability

The utilization of single-use (SU) systems continues to grow, and so do the purity concerns of the SU components and their potential impact on high-value final products. From the high cost of product loss due to assembly failures, to the challenges of maintaining compliance in an evolving global regulatory landscape, every angle requires protective measures.

Entegris brings a new level of assurance to your process. Our Aramus™ single-use assembly product design incorporates high purity, integrity, and performance standards of the microelectronics industry with the regulatory and quality requirements for life sciences. Entegris allows you to protect and store your high-value process solutions with reduced risk of product loss, contamination, and compromised quality.

Aramus single-use 2D bags are made of a high-grade, gamma-stable fluoropolymer, and provide high purity, exceptional compatibility, and increased safety for critical process fluids and final products. The innovative single-layer technology does not contain curing agents, antioxidants, plasticizers, or adhesives, so the potential for process fluid contamination is greatly reduced. These subassemblies withstand a wide operating temperature range (-196° to 121°C [-321° to 250°F] or lower), without negatively affecting the film; making them extremely durable in frozen applications.

Aramus single-use assemblies are manufactured in an ISO® Class 5 cleanroom and provide high purity, performance, quality, and safety for your process.

Provides a new level of assurance for your frozen product.

APPLICATIONS

- Frozen product storage and shipment
- Cell culture freezing and storage

Custom manifolding enables process efficiency in any application.

FEATURES & BENEFITS

Wide temperature operating range	Maintains mechanical properties across a wide range of process temperatures. Reduces bag breakage and can be used in cold temperature applications to -196°C (-321°F) or lower without negatively affecting bag or boat fitment.
Single-layer, fluoropolymer construction	Single-layer design does not delaminate, reducing the risk of material failures and product loss caused by delamination. Exhibits chemical compatibility with a wide range of process chemicals including strong acids, strong bases, oils, lipids, and organic solvents, without affecting the material or product.
Gamma-stable fluoropolymer film	Withstands market-standard gamma sterilization, from 25 to 40 kGy.
High-purity fluoropolymer materials	Reduces the number of potential contaminants (adhesives, binders, etc.) introduced to final product. The high hydrophobicity of the fluoropolymer film has low potential to absorb active pharmaceutical ingredients and critical formulation excipients, reducing yield loss. Have low particulates, low bioburden, and low endotoxin, increasing purity.
Manufactured in an ISO Class 5 certified cleanroom	Operators properly trained on gowning and handling procedures increases contamination control. Mitigates contamination and maintains components low bioburden levels.
Multiple connectivity options	Provides greater flexibility when incorporating into an already validated process.

Multiple connectivity options enable process flexibility.
